

REGULATORY PERMITTING

Federal Level - EPA, NEPA - BLM, USFS,
USACE, TRIBAL/BIA
State Level - COGCC, NMOCD, CDPHE
County/Municipality Land Use
Permitting

Since 2002, HRL Compliance Solutions, Inc. (HRL) has been providing environmental and regulatory permitting services for various development industries, including oil and gas. These include environmental assessments and biological surveys; NEPA checklists and processes for towers, pipelines, well pads, compressor stations, or seismic operations; stormwater compliance; waste management compliance; wetlands/404 delineation and permitting; floodplain permitting; right-of-way permits/authorizations; remediation; pit closures; and sensitive area determinations. HRL can assist your company with all of the surveys and permits required for regulatory and environmental compliance.

HRL specializes in guiding and representing our clients through NEPA processes, city and county land use development of federally-required plans, including SPCCs, and navigating surface use requirements on state, federal, and tribal lands. Our experience within the oil and gas industry is comprehensive and our offices in Colorado specialize in state-specific permitting requirements. We understand oil and gas operations and the forms, permits and process required by regulatory agencies.

Wetlands

HRL has certified wetland scientists in the field determining US Army Corp of Engineers (USACE) and any applicable state and/or county jurisdictional waters on a variety of projects. HRL can guide clients on the best course of action to take during the planning and construction period on any type of project. HRL can also determine which projects may qualify under the USACE nationwide permitting program and regional general conditions when an individual permit is required, as well as prepare preconstruction notification (PCN) documents and any other jurisdictional waters permit applications required by the State and/or County, if needed. On behalf of our clients, HRL can facilitate communications with the USACE and any other applicable permitting agency.

Wetland scientists delineate, survey, and stake all potential Section 404 Clean Water Act concerns onsite prior to permitting and proposed construction. Detailed reports and maps are provided to the client allowing for a quick and professional documentation and presentation to the regulatory agencies as required.
